

**Active Case Finding**

With increasing reputation on the ground team ZMQ was involved in Active Case Finding conducted by Government of India in January 2017. With lots of paper work and management, team was not able to cover the target given to them; at that point ZMQ launched its *TB Referral Toolkit*. This toolkit was developed for the first level house-to-house screening of the patients by asking them 5 set of symptomatic questions related to Pulmonary and Extra-Pulmonary TB. The patients are then referred to the appropriate dispensary for the sputum test. With using it for early screening and detection of the TB suspects and contacts, this toolkit was also used by field functionary to disseminate the information about Tuberculosis prevention and care in the community using TB learning zone.
